IncidentPulse AI

Is it your code or their cloud?
Answered in seconds.

Team Blaze Matrix

HackIIITD 2026, powered by TinyFish

The problem with modern apps

Modern apps depend on 10+ third-party services

Domino Effect

One slow service crashes the whole app

Unannounced API Updates

Breaking existing code unexpectedly

Traffic Spikes

Sudden load overwhelms dependencies

Human/Deploy Errors

Mistakes causing downtime

Downtime costs more than you think

Industry estimates

Gartner

$5,600

per minute of downtime

ITIC

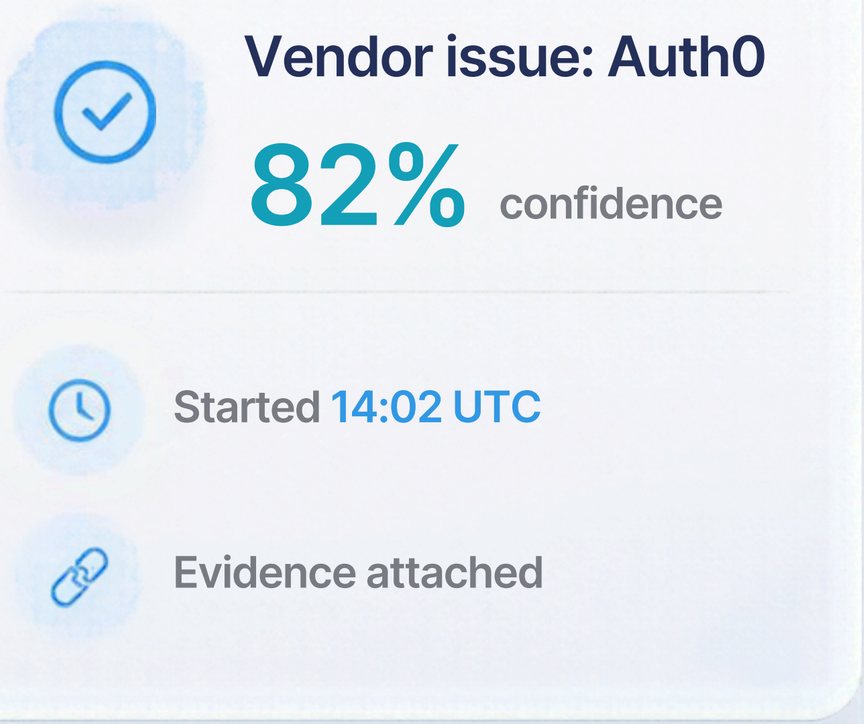
>$300K

per hour for mid-size/ large firms

Developers waste hours asking whether the bug is theirs or the vendor’s

IncidentPulse AI

The verdict, not just alerts



Blame Detector

Pinpoints vendor vs your code with confidence score

Change Radar

Detects unannounced API, doc, changelog changes & flags endpoints

Auto Incident Brief

One-click summary for Slack/email

Before

Hours of manual debugging

After

Seconds to verdict

Who Benefits from IncidentPulse AI?

Built for teams that feel downtime the most

Startups without SRE teams

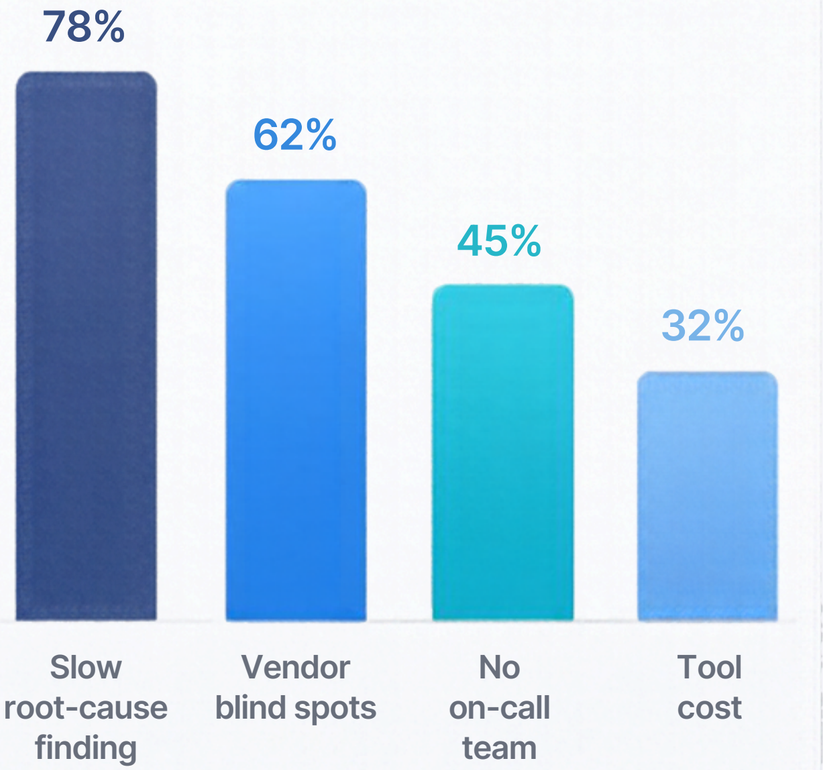
Indie developers and agencies

Student and hackathon teams

Small SaaS and e-commerce teams

Target user segments

Top pain points



Technical Architecture & Tech Stack

From signal collection to actionable incident intelligence

TinyFish Web Agents

status pages
changelogs
forums
X/Reddit

Signal Normalize

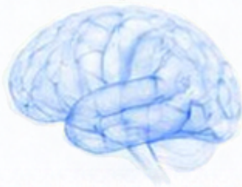
cleans and standardizes incoming signals

Correlation Engine

joins with App Logs + Latency Ingest via SDK/webhook

LLM Reasoning Layer

understands context and detects incidents



Dashboard

real-time visibility and insights

Slack/Email Alerts

instant notifications to the right people

Incident Brief

concise summaries and root cause

TECH STACK

Frontend	Backend	Database	Queue & Scheduler	AI
Next.js Tailwind CSS	Node.js or FastAPI	PostgreSQL / Supabase	Redis / Cron	LLM API

Integrating TinyFish API

A multi-source data layer that powers real-time incident intelligence

Status Page Agents

Stripe, AWS, Auth0
live service states

Changelog & Deprecation Agents

Detect doc &
release note changes

Community Signal Agents

Forums, Reddit, X
outage reports

Scheduled sweeps
+ on-demand sweep
triggered by
user error spike

→

Conversion to
structured JSON

→

Feed into
correlation engine

→

Incident signals
ready for analysis
and alerting

Source	Extracted Signal	Refresh Frequency
Status Pages	Live uptime & incident status	Every 5 min (Illustrative)
Changelogs	API changes & deprecations	Daily (Illustrative)
Community Forums	Early outage reports	On event (Illustrative)

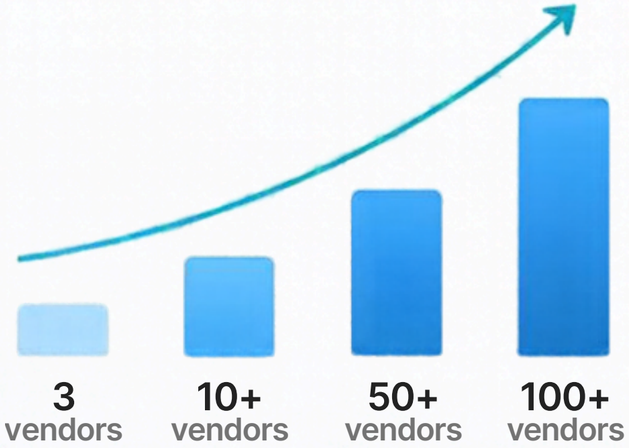
Scalability, Feasibility & Use Case

MVP roadmap (24 hours)

- **0-6** Setup and agents
- **6-14** Correlator and ingest
- **14-20** Dashboard and verdict UI
- **20-24** Demo polish

Scoped to 3 vendors (illustrative)

Scales with ease



Add vendors via config file

Stateless, parallel agents

Free & paid plans

From incident to verdict in minutes

Friday 2 AM Checkout falls

Spike detected

Agents sweep & correlate

Verdict: "Stripe degraded" in ~10 seconds

vs 3 hours debugging

(Illustrative)

Demo Flow

From setup to actionable verdict in four steps

01

Connect app and pick vendors

Bring data and define your service map

02

Simulate error spike

Recreate incidents in minutes

03

Agents sweep and engine correlates

Auto-discover, correlate, and explain

04

Verdict with evidence and generate brief

Clear findings with supporting proof

How IncidentPulse AI Stands Out

	Status Aggregators	APM Tools	IncidentPulse AI
Vendor status	✗	✗	✓
Your app data	✗	✓	✓
Verdict (you vs them)	✗	✗	✓
Doc change warnings	✗	✗	✓
